## How to Select the Correct LED Driver for Your Load

**Note:** Try our LED Driver Selection Tool online at [www.lutron.com/leddrivertool](http://www.lutron.com/leddrivertool)

1. Review the specifications of the LED load.
  - a. Identify if the LED load requires a “constant current” or a “constant voltage” driver. Contact the LED load manufacturer for information on the type of load.
  - b. Identify the minimum and maximum operating voltage of the LED load at the desired operating current. This “current” will be the rated output current of the LED driver. Consult the LED load manufacturer for any questions.

The examples below are for a Class 2 constant current application:

Example 1: A Class 2 LED load that is rated at 1 A and 38 V<sub>nom</sub> nominally, and has an output voltage range of 36–40 V<sub>op</sub> (at 1 A) due to unit-to-unit variation, temperature, etc.

Example 2: A Class 2 LED load that is rated at 1 A and 40 V<sub>nom</sub> nominally, and has an output voltage range of 38–42 V<sub>op</sub> (at 1 A) due to unit-to-unit variation, temperature, etc.

2. Determine the proper operating range of the LED driver.

- a. Identify the output current range(s) of the driver family that includes the desired current.

Examples 1 & 2: Only “F”, “I”, “J”, and “Z” models meet the current range of the selected load (1 A).

### LED Load Output Range (see the following pages for more detail):

#### Class 2 Constant-Voltage

A = 10.0 V–12.0 V\*  
 B = 12.5 V–20.0 V\*†

**Z = 0.51 A–1.00 A 30 V–60 V†**

\* Available in K-case only.

† Output parameter is power-limited for these output ranges. Consult detailed specifications on the following pages for each range.

- b. Identify output voltage range(s) of the driver that includes the desired voltage range.

Examples 1 & 2: Out of the 3 models indicated in step 2a, only “F” and “Z” models meet the voltage requirement for the selected loads.

### LED Load Output Range (see the following pages for more detail):

### How to Select the Correct LED Driver for Your Load *(continued)*

3. Identify if the driver needs to be Class 2. Examples 1 & 2: Out of the “F” and “Z” models, only the “F” model is Class 2.

a. Examine the Load Compatibility graphs below for each output range to ensure that the voltage range of the LED load is within the safe operating area.

Example 1: The LED voltage range of 36 V<sub>DC</sub> to 40 V<sub>DC</sub> falls entirely within the operating area of output range F, so this is a compatible output range.

The model numbers for this example are:

- LTEA4U1UMN-FA100 M-Case, constant-current reduction dimming
- LTEA4U1UKL-FA100 UL<sup>®</sup> Listed, remote-mountable, constant-current reduction dimming
- LTEA4U1UKN-FA100 K-Case, non-studded, constant-current reduction dimming
- LTEA4U1UKS-FA100 K-Case, studded, constant-current reduction dimming

Example 2: The LED voltage range of 38 V<sub>DC</sub> to 42 V<sub>DC</sub> does not fall entirely within the operating area of output range F, so this is not a compatible output range.

## Load Learning

### What is load learning?

Each Lutron constant-current LED driver is able to operate over a range of LED load voltages. In order to operate with optimum efficiency, these drivers continuously sense the LED load voltage and make adjustments to their internal operation.

### When does load learning happen?

Load learning happens continuously and in most cases is imperceptible. However, when a new load is connected to the driver it will take some time for the LED driver to adapt. A driver may be performing load learning during R&D/bench testing, production testing, or QwikFig/AirFig configuration when using a real load. If a driver was not allowed to learn its load during the fixture production process, it may happen when first installed in the final location.

### What does load learning look like?

Depending on the difference in forward voltage of the new load versus the last load the driver learned, one of the following may be observed:

1. The load may seem to operate properly.
2. The load may turn on at a low light level and remain there for a few seconds before transitioning to full light.
3. The load may turn on for a very brief flash, then go off for a few seconds before turning back on again.
4. There may be no light output at all for up to 20 seconds.

### How do I make a driver “learn” a new load?

Although this process will happen on its own during normal usage, Lutron recommends the following procedure be carried out before attempting to confirm proper operation:

1. Power up the LED driver on the intended load.
2. Once the light seems to be stable at full output, which may take 20 to 30 seconds, leave the driver on for another 20 seconds for the driver to learn the load voltage and commit it to memory.

**Note:** There is no limit to the number of times a driver can learn a new load.
