

Overview

When selecting non-dim as a load source on a GRAFIK Eye Control Unit or the circuit selector in a dimming panel, there are two options for the "timing" of when the non-dim load turns ON and OFF.

FONFOFF	First On, First Off
LONFOFF	Last On, First Off

FONFOFF (First On, First Off)

FONFOFF is ideal for applications where the user wants the non-dim load to turn on immediately and be the first load off.

Motorized Shade or Screen

When selecting a preset for an A/V presentation, the user wants shades to begin to close and the screen to drop as the lights gradually dim to off. After the presentation, the shades should start to open immediately and the screen should rise as the lights come back on.

HID Sources

HID lamps take time to warm up, therefore this source should be the first to come on. A fade time corresponding with the time required for this warm up could be programmed so the dimmed sources reach full light output at approximately the same time.

LONFOFF (Last On, First Off)

LONFOFF is ideal when you have a non-dim load, such as a switched fluorescent, that the user wants to be the last load on and the first load off.

Switched Fluorescent

When leaving a room, the other load sources may be dimming to OFF and the fluorescent switched load will be the first to shut OFF. When the lights are returned to ON, the other loads may slowly dim ON and once the lights are at the appropriate level, the switched fluorescents will come on last.
